Christopher's Story

Our son Christopher is an exceptional 4 year old boy. He was diagnosed with optic nerve hypoplasia (small optic nerves) and associated mixed muscle tone at the age of four and a half months. Physically speaking, Chris’s condition resembles cerebral palsy.

Christopher has always had low muscle tone throughout his core. It was his inability to hold himself upright that made us eager to enroll him in a Hippotherapy program at age two. The sustained motion of the horse walking is something no other physical therapy modality can duplicate. Ride On is the closest licensed Hippotherapy program to our home in the San Gabriel Valley, but we feel it’s important enough to travel quite a distance to get there.

When Christopher first started at Ride On, he was frightened of the horses and could do little more than lie flat as a pancake on top of them. With much patience and care, his Physical Therapist gradually acquainted him with one of Ride On’s oldest horses.

Over the past two years Christopher has not only developed a love of horses, he has greatly increased his core strength and can hold his own while his horse walks and sometimes trots.
